# 10 checks before a change touches a client's ad account.

The checks behind every change in Adspenta. They work with any tool, or with a person and a spreadsheet.

## 01 Is this account allowed to change at all?

Live changes are off for every account until someone turns them on, one account at a time.

## 02 Was switching it on deliberate?

Turning live changes on takes a typed confirmation. Clicking through a dialog is not a check.

## 03 Who said yes?

A named person. Or a rule that a named person switched on, and can switch off.

## 04 How big is it?

A limit on how far one approval can move a budget, so one yes can’t move everything.

## 05 When was it last touched?

A cooldown between changes to the same thing. Picked from a list, never typed.

## 06 How many today?

A cap on how many changes one account can take in a day.

## 07 Is it inside the floor and ceiling?

A budget never goes below or above what the agency set for that account.

## 08 Can it still be taken back?

A window after the yes, before anything reaches the platform. Five minutes is a good default.

## 09 Did the platform confirm it?

Read the new value back. Until then it says “Unconfirmed”, never “Confirmed”.

## 10 Did it work?

Check again at +7 and +14 days against the account’s own baseline: improved, worse, no change, or not enough data to say.

AND ONE MORE

# One switch that stops new changes.

On every account, at once. Nothing new goes out until a person releases it.

I build Adspenta around these checks. I write here about what breaks when software touches client ad accounts.
